Main Research Question: **Does temporal overlap correction improve Back-to-Back regression's ability to disentangle the contributions of correlated predictors in fixation-related EEG?**

RQs	Evaluation
Simulation: Does temporal overlap correction improve B2B's recovery of correlated predictors under controlled overlap and confounding conditions?	• Visual comparison against known ground truth
ROAMM: How does temporal overlap correction affect B2B's estimated feature-specific contributions of word length, frequency and surprisal during natural reading?	• Plain versus Two-step B2B contribution curves • Optional paired statistical comparison

ROAMM evaluation:

Statistical question	Proposed evaluation
Does overlap correction change feature-specific predictive importance?	Paired tests on held-out feature-knockout ΔR
Does two-step B2B produce different S from plain B2B?	Paired time-window specific subject-level differences with H_0: $\mathbb{E}[S_{two-step} - S_{plain}] = 0$

B2B paper: Feature knockout evaulation **excluded backward decoding**: $\Delta R_{B2B}\ versus\ \Delta R_{Forward/CCA}$

Backward decoding was examined descriptively, they add a dummy variable to the real data, and showed that backward decoding can mislead feature attributions and can not be used to estimate the causal contribution of correlated features.
